

Architecture Group

- **Concern that it's still very processor centric**
- **What is possible to do with the system if we can change memory controller?**
- **Why no mention of PIM?**
- **Would be nice to know exactly what willing to do (similar to what the Apps group presented)**
- **Need to think about VM for the entire system (apps, OS, and architecture). Existing models might not have an end-point that is acceptable**
- **What about making load / store consistency very loose and making it entirely system software (compilers) problem**
